### Models

Nine-decade Model with 1 mΩ resolution

Eleven-decade model with 1 mΩ resolution, offering wide range and high resolution

### Rheostat

For high-resolution applications, a 10 mΩ rheostat may be added for the lowest step. It is a 0.20 μΩ resolution “decade”. In order to eliminate contact resistance and thermal emf, the HARS-LX integrates the rheostat as shown. In this way, the wiper is in the low potential circuit, which is the high impedance lead. As a result, voltage and contact resistance effects are removed by being effectively added to the input impedance of the measuring instrument.

#### Minimum resistance:

For models with 10 mΩ or lower the minimum is 10 mΩ ± 0.5 mΩ; determined by the lowest settable position, "1", of the 10 mΩ/step decade.

#### Resistance repeatability:

Better than 100 μΩ, short-term, average value

#### Leakage Resistance:

>10 GΩ

#### Environmental Conditions:

**Operating Temperature:** 0°C to 55°C

**Storage Temperature:** -40°C to 70°C

#### Switch Type:

Multiple solid silver contacts; dust-tight diallyl-phthalate body. To allow continuous rotation, a blank position is added on most decades.

#### Terminals:

Four, 5-way, gold-plated, tellurium-copper binding posts with low thermal emf and low resistance, for four-terminal Kelvin measurements, plus one binding post connected to case for shielding. Rear outputs are available as an option.
